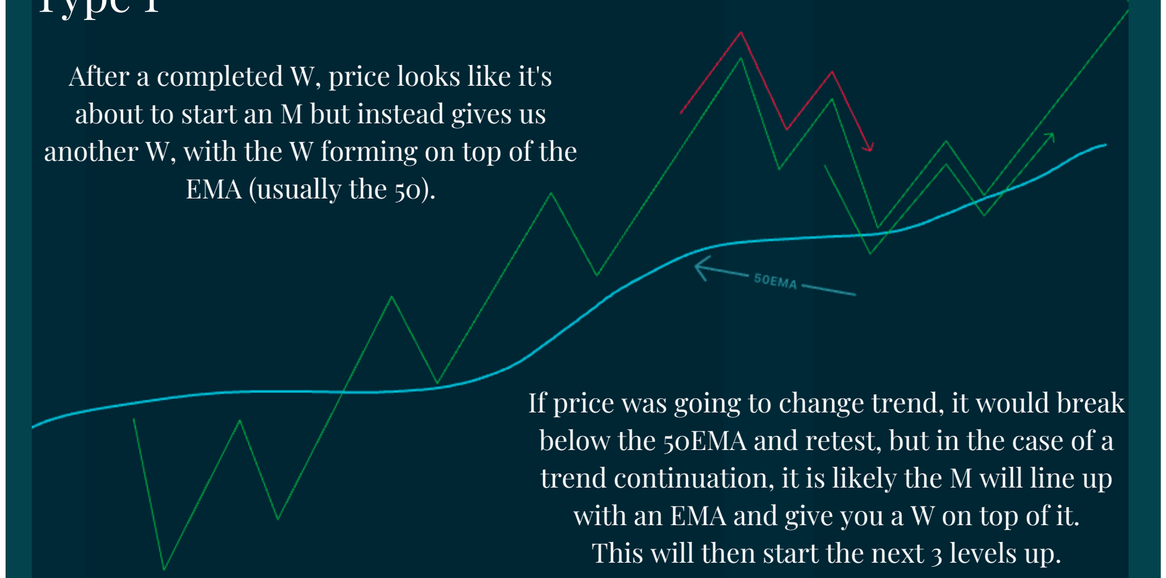
MARKET RESETS

Type 1

After a completed W, price looks like it's about to start an M but instead gives us another W, with the W forming on top of the EMA (usually the 50).



If price was going to change trend, it would break below the 50EMA and retest, but in the case of a trend continuation, it is likely the M will line up with an EMA and give you a W on top of it. This will then start the next 3 levels up.

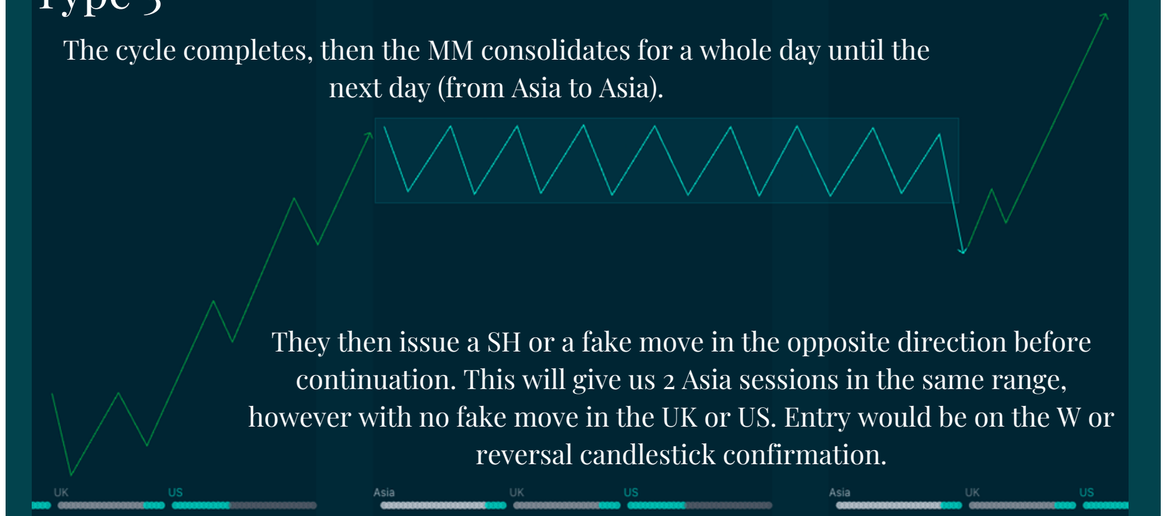
Type 2

Here we have 2 consecutive days where the Asia session is formed close to the same level (it doesn't have to be exact, but around the same level as it was the day before).
During UK and US, you will find fake outs to the high and low (either way, there is no rule here), and then Asia falls back to around the same price as the day before.
These 2 Asia boxes then become the reset.

This happens because we know price moving sideways = MM accumulating contracts (likely a big move is coming next). We need to wait for the final stop hunt out of the second Asian session.
SH to the high - likely to take price down. SH to the low - likely to take price up.

Type 3

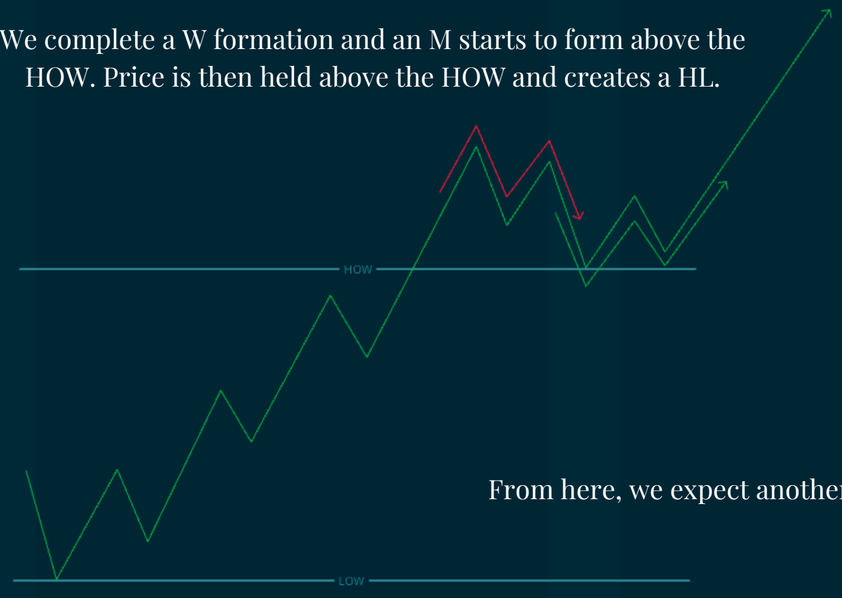
The cycle completes, then the MM consolidates for a whole day until the next day (from Asia to Asia).



They then issue a SH or a fake move in the opposite direction before continuation. This will give us 2 Asia sessions in the same range, however with no fake move in the UK or US. Entry would be on the W or reversal candlestick confirmation.

Type 4

We complete a W formation and an M starts to form above the HOW. Price is then held above the HOW and creates a HL.



From here, we expect another 3 rises.
